E357

0.2 mm
Ld₂, As₁, Ag₁

Ld₂, As₁, Ag₁ Lam - 0.3-1.0 mm, faint
99% brown
1% grey as leaf
to leaf

Oxidized and/or tumbled
m/gc? or just m/gc
in lower part?

3 mm
gc1? Ld₂, As₁, Ag₁, Dg₊, Dh₊
dark brown with fine filineous organics

Ld₂, As₁, Ag₁ Lam - 0.1-0.5 mm, faint
100% brown
to grey
to leaf

Ld₂, As₁, Ag₁ Lam - 1.0-2.5 mm
60% brown
40% grey
to leaf

Ld₂, As₁, Ag₁ Lam - 0.1-0.5 mm
97% brown
3% grey
to leaf

10 mm
Ld₂, As₁, Dh₁, Dg₊

Ld₂, As₁, Dh₁, Dg₊ 20% filineous organics
dl+gc1
90% brown
10% leaf

3.5 mm
Ld₂, As₁, Dh₁ Dg₊₊

↓
Decreasing
organics
dl+gc1 following impregnation
of part leaf
So where is m/gc??
They are really look like gc1
& don't match stratigraphically
with DE 8, yet

Sh₂, Dh₁, Th₃, D1+, As₊
carbon, filineous

Sh₂, As₁, Dh₁, Dg₊, Th₃
Sh₂, Dh₁, Th₄, As₊, D1+
carbon, filineous

ARN94-39 373cm
1cm thick section of $\frac{1}{2}$ of core
all fossils horizontal in part.
Submitted: 3 frags of leaf
stem base, $\frac{1}{2}$ leaf seed
pod 21.5 mg
3740 ± 55 BP - 22.8%
AA-17133 3H, 2S (A)

3 mm
Sh₂, As₁, Dh₃, Th₃, As₊

Carbon filineous sections of peat interbedded
with more decomposed parts. 5 cm piece
breaks more easily horizontal, part
mainly vertical. Few vertical roots
but they may be decomposed.
Looks like typical "low mark" sediment.

3 mm
Sh₂, As₁, Dh₁, Th₄
Stick in center

3 mm
Sh₃, Dh₁, Th₄, As₊
10 YR 2/1-1/1 oxidized
7.5 YR 2/2-2/3 unoxidized
vivianite

3 mm
Sh₂, Dh₁, Th₄, D1+
wood fragment
Stained leaf & stems, but
turned brown/dark brown
on exposure.
vivianite

400
Ld₂, As₁, Ag₁ Lam - faint
100% brown
to leaf

ARN94-40 401 cm
Peat from $\frac{1}{2}$ core, little mud.
Submitted: 3 frags leaf stems
carbon, spores, & humlock needles
3700 ± 50 BP 16.3 mg
AA-17134 4N, 1H (D)

1 mm
Ld₂, As₁, Ag₁ Lam - 0.5-1.2 mm, well
70% brown
30% grey

W here is gc1
& m/gc?
